The ATM Forum hereby grants the limited right to reproduce this specification/document in whole, but not in part, for the purpose of including this specification/document, at no extra cost and on an "as is" basis, in documentation for products. This right shall not be, and is not, transferable. Any material so included shall contain all of the disclaimers and propriety and other notices contained herein or therein. All other rights reserved. Except as expressly stated in this notice, no part of this specification/document may be reproduced or transmitted in any form or by any means, or stored in any information storage and retrieval system, without the prior written permission of The ATM Forum.

The information in this publication is believed to be accurate as of its publication date. Such information is subject to change without notice and The ATM Forum is not responsible for any errors. The ATM Forum does not assume any responsibility to update or correct any information in this publication. Notwithstanding anything to the contrary, neither The ATM Forum nor the publisher make any representation or warranty, expressed or implied, concerning the completeness, accuracy, or applicability of any information contained in this publication. No liability of any kind shall be assumed by The ATM Forum or the publisher as a result of reliance upon any information contained in this publication.

The receipt or any use of this document or its contents does not in any way create by implication or otherwise:

- Any express or implied license or right to or under any ATM Forum member company's patent, copyright, trademark or trade secret rights which are or may be associated with the ideas, techniques, concepts or expressions contained herein; nor
- Any warranty or representation that any ATM Forum member companies will announce any product(s) and/or service(s) related thereto, or if such announcements are made, that such announced product(s) and/or service(s) embody any or all of the ideas, technologies, or concepts contained herein; nor
- Any form of relationship between any ATM Forum member companies and the recipient or user of this document.

Implementation or use of specific ATM standards or recommendations and ATM Forum specifications will be voluntary, and no company shall agree or be obliged to implement them by virtue of participation in The ATM Forum.

The ATM Forum is a non-profit international organization accelerating industry cooperation on ATM technology.

The ATM Forum does not, expressly or otherwise, endorse or promote any specific products or services.

NOTE: The user's attention is called to the possibility that implementation of the ATM interoperability specification contained herein may require use of an invention covered by patent rights held by ATM Forum Member companies or others. By publication of this ATM interoperability specification, no position is taken by The ATM Forum with respect to validity of any patent claims or of any patent rights related thereto or the ability to obtain the license to use such rights. ATM Forum Member companies agree to grant licenses under the relevant patents they own on reasonable and nondiscriminatory terms and conditions to applicants desiring to obtain such a license. TABLE OF CONTENTS

1	INTRODUCTION.....	7
2	MIB TABLE RELATIONSHIPS	7
3	RELATIONSHIPS BETWEEN LOGICAL MIB AND SNMP MIB.....	8
4	SNMP MIB FOR ATM LAYER AUTOMATIC PROTECTION SWITCHING (APS).....	10
5	REFERENCES	36

1 Introduction

This document defines an SNMP MIB for management of ATM Layer APS according to the logical model described in [1].

2 MIB table relationships

The figure below illustrates how the ATM APS MIB tables are related to each other and to the IETF AToMMIB VCL and VPL tables as defined in [3]. The 'Working Vpl/Vcl' and the 'Protection Vpl/Vcl' and corresponding cross-connections (if applicable) are created in the way described in [3] using the atmVclTable, atmVplTable, atmVpCrossConnectTable and atmVcCrossConnectTable respectively. The associated APS entities are then created afterwards pointing to the previously created VCLs or VPLs through the Ifindex, Vpi or IfIndex, Vpi, Vci. The atmfApsWpPairTable, atmfApsCurrTable and atmfApsHistTable entries are related to the APS end point through the EpIndex.

3 Relationships between logical MIB and SNMP MIB

The table below illustrates how the entities of the logical MIB are mapped into corresponding entities in the SNMP MIB.

Logical MIB managed entity	Logical MIB attribute	SNMP MIB table	SNMP MIB attribute
ATM APS End Point		atmfApsEpTable	
	Managed entity id		atmfApsEpIndex
	Protection Scheme		atmfApsEpProtScheme
	Protection Direction		atmfApsEpProtDirection
	Protection Mode		atmfApsEpProtMode
	Group Protection Indicator		atmfApsEpGroupIndicator
	Working/Protection Pair List		-
	-		atmfApsEpTestTrailSignalId
	ATM APS Test Trail Working Entity		atmfApsEpTestTrailWorkingIf atmfApsEpTestTrailWorkingVpi atmfApsEpTestTrailWorkingVci
	ATM APS Test Trail Protection Entity		atmfApsEpTestTrailProtectionIf atmfApsEpTestTrailProtectionVpi atmfApsEpTestTrailProtectionVci
	Coupling Indicator		atmfApsEpCouplIndicator
	ATM APS Trigger List		atmfApsEpTriggers
	Hold Off Timer		atmfApsEpHoldOffTimer
	WTR Timer		atmfApsEpWtrTimer
	Set/Clear ATM APS Request (actions)		atmfApsEpManualRequest
	ATM APS Request List		atmfApsEpApsRequestList
	Current K1K2 Byte		atmfApsEpCurrentK1Byte atmfApsEpCurrentK2Byte
	Selector Status		atmfApsEpSelectorStatus
	Bridge Status		atmfApsEpBridgeStatus
	ATM APS Availability Status		atmfApsEpAvailabilityStatus
-	atmfApsEpRowStatus		
ATM APS Working/Protection Pair		atmfApsWpPairTable	
	Managed Entity Id		atmfApsWpEpIndex atmfApsWpPairWorkIf atmfApsWpPairWorkVpi atmfApsWpPairWorkVci atmfApsWpPairProtIf atmfApsWpPairProtVpi atmfApsWpPairProtVci
	-		atmfApsWpPairSignalId
	Supported Working Termination		atmfApsWpPairWorkIf atmfApsWpPairWorkVpi atmfApsWpPairWorkVci

Logical MIB managed entity	Logical MIB attribute	SNMP MIB table	SNMP MIB attribute
	Supported Protection Termination		atmfApsWpPairProtIf atmfApsWpPairProtVpi atmfApsWpPairProtVci
	-		AtmfApsWpPairRowStatus
ATM APS Current Data		atmfApsCurrTable	
	Managed Entity Id		atmfApsEpIndex
	Administrative state		-
	Suspect Flag		atmfApsCurrSuspect
	Elapsed Time		atmfApsCurrElapsedTime
	Threshold Data Id		-
	Number Of Suppressed Intervals		atmfApsCurrSupprIntvls
	Failure to Switch on SF/SD		atmfApsCurrFailSwOnSfSd
	Failure to Switch after WTR expired		atmfApsCurrFailSwOnWtr
	Failure to Switch after Far-End Switch		atmfApsCurrFailSwNearEnd
	Failure to Switch after Near-End Switch		atmfApsCurrFailSwFarEnd
	Successful Switches		atmfApsCurrSuccessSwitch
ATM APS Extra Traffic		atmfApsExTrafTable	
	Managed Entity Id		atmfApsExTrafEpIndex atmfApsExTrafProtectionIf atmfApsExTrafVpi atmfApsExTrafVci
	-		atmfApsExTrafSignalId
	Extra traffic link		atmfApsExTrafProtectionIf atmfApsExTrafVpi atmfApsExTrafVci
	-		atmfApsExTrafRowStatus
ATM APS History Data		atmfApsHistTable	
	Managed Entity Id		atmfApsEpIndex atmfApsHistIndex
	Period End Time		atmfApsHistPeriodEndTime
	Suspect Flag		atmfApsHistSuspect
	Number Of Suppressed Intervals		atmfApsHistSupprIntvls
	Failure to Switch on SF/SD		atmfApsHistFailSwOnSfSd
	Failure to Switch after WTR expired		atmfApsHistFailSwOnWtr
	Failure to Switch after Far-End Switch		atmfApsHistFailSwNearEnd
	Failure to Switch after Near-End Switch		atmfApsHistFailSwFarEnd
	Successful Switches		atmfApsHistSuccessSwitch

```

AtmfApsFailToSwitchType ::= TEXTUAL-CONVENTION

STATUS current

DESCRIPTION

"This object defines which type of failure that is experienced when the ATM APS function fails to switch at an APS triggering event. In case the switching is successful this object will have the value 'none'.

The different switch failure reasons are:

- localFailToSwitchAtSfSd:
This means that this APS End Point fails to switch when it experiences a signal fail or signal degrade at the working or protection entity.
- localFailToSwitchAtWtr:
This means that this APS End Point fails to switch back to the working entity when the wait to restore timer expires.
- localFailToSwitchAtSwFarEnd:
This means that this APS End Point fails to switch when a switch occurs at the remote end of the protected domain (at bi-directional protection switching)."

```

::= { atmfApsConnGroup 1 }

atmfApsEpEntry OBJECT-TYPE

SYNTAX AtmfApsEpEntry

MAX-ACCESS not-accessible

STATUS current

DESCRIPTION

"Each entry in this table specifies an ATM APS End Point which represents one end of a protected domain. The APS End Point may be related to one atmfApsWorkProtPairEntry if single protection, or to a number of atmfApsWorkProtPairEntry if group protection.

To create a single protected connection the following steps shall be taken:

- Create the working atmVclEntry or atmVplEntry, if it is not already existing (This VCL or VPL may at this stage already be cross connected).
- Create the protection atmVclEntry or atmVplEntry
- Create the atmfApsEpEntry specifying the protection scheme etc. and setting the atmfApsEpGroupIndicator to 'single'.
- Create the atmfApsWpPairEntry pointing to the working and protection VCLs or VPLs using the index of this atmfApsEpEntry as part of the row index.

To create a protected group the following steps shall be taken:

- (0) Create the atmfApsEpEntry specifying the protection scheme etc. and setting the atmfApsEpGroupIndicator to 'group'. The working and protection test trails shall also be specified here by setting the associated objects in the atmfApsEpEntry. These objects are:
 - atmfApsEpTestTrailSignalId
 - atmfApsEpTestTrailWorkingIf
 - atmfApsEpTestTrailWorkingVpi
 - atmfApsEpTestTrailWorkingVci
 - atmfApsEpTestTrailProtectionIf
 - atmfApsEpTestTrailProtectionVpi
 - atmfApsEpTestTrailProtectionVci
- (1) Create the working atmVclEntry or atmVplEntry, if it is not already existing (This VCL or VPL may at this stage already be cross connected if it is not located at the end of the VCC or VPC). At group protection the working VCL or VPL must always be located at the same interface as the working test trail.
- (2) Create the protection atmVclEntry or atmVplEntry. At group protection the protection VCL or VPL must always be located at the same interface as the protection test trail.
- (3) Create a atmfApsWpPairEntry pointing to the working and protection VCLs or VPLs using the index of this atmfApsEpEntry as part of the row index.
- Repeat step (1) to (3) for each connection that shall belong to the protected group

To remove a single protected connection first remove the atmfApsWpPairEntry row (and the two associated atmVplEntry or atmVclEntry rows) and then remove the atmfApsEpEntry row.

To remove a protected group first remove all atmfApsWpPairEntry rows of the group (and the associated atmVplEntry or atmVclEntry rows) and then remove the atmfApsEpEntry row. Removing of the atmfApsEpEntry row will also remove the test trails associated with it.

MAX-ACCESS read-create

STATUS current

DESCRIPTION

"This attribute enables activation and clearing of the different manual requests that may be performed towards an APS End Point. The different requests that may be set or cleared are:

- freeze :
This will freeze the bridge-selector in the current position and thus prevent any protection switching for this APS End Point. This request may be combined with any of the requests below.
- lockoutOfProtection :
This prevents any protection switching from the working to the protection entity. If the traffic was routed to the protection entity it will be forced back to the working entity.
- forcedSwitchForWorking :
This will force the traffic from the working entity to the protection entity unless there are any higher priority requests.
- manualSwitchForWorking :
This will force the traffic from the working entity to the protection entity unless there are any higher priority requests. A signal fail or a signal degrade will have higher priority than this request.
- manualSwitchForProtection :
This will force the traffic from the protection entity to the working entity unless there are any higher priority requests. A signal fail or a signal degrade will have higher priority than this request.

The clearAll action will clear all active manual requests through one set operation, thus avoiding clearing of each active request separately. The requests that will be cleared through the clearAll command are the 'Freeze', 'Lockout of protection', 'Forced switch for working', 'Manual switch for working' and 'Manual switch for protection'. Any active automatic requests (non operator initiated request) will not be affected by the clearAll command.

When read this attribute will have the value 'noOp'. The active requests are instead displayed through the atmfApsEpApsRequestList attribute."

atmfApsEpTestTrailWorkingIf OBJECT-TYPE

SYNTAX InterfaceIndex

MAX-ACCESS read-create

STATUS current

DESCRIPTION

"This object identifies the interface of the working test trail at group protection.

NOTE: The test trail objects must be specified prior to creating any objects in the atmfApsWpPairTable at group protection.

When a VCC test trail is created, the three objects :

- atmfApsEpTestTrailWorkingIf
- atmfApsEpTestTrailWorkingVpi
- atmfApsEpTestTrailWorkingVci

shall be included in one set operation so that the underlying VCC used to terminate the working test trail may be created.

When a VPC test trail is created, the two objects :

- atmfApsEpTestTrailWorkingIf
- atmfApsEpTestTrailWorkingVpi

shall be supplied in one set operation to create the test trail VPC."

MAX-ACCESS not-accessible
STATUS current
DESCRIPTION

" Each entry in this table represents a protected VP or VC connection.

In case of protection of a single connection there will be a one to one relationship between this entry and the corresponding atmfApsEpEntry.

Several entries in this table may be related to one atmfApsEpEntry in case of group protection. In this case the entries will use the same atmfApsWpEpIndex.

When a row in this table is created there must already exist two rows in the atmVclTable or atmVplTable that this entity may point at. These two entities shall be configured with the same traffic contract (traffic descriptors).

The two entities shall also be of the same type:
 - if one Vpl is terminated (used for VC switching)

- the other Vpl shall be terminated as well.
- if one Vcl is terminated the other Vcl shall be terminated as well.
 - if one Vcl/Vpl is intended for cross-connection the other Vcl/Vpl shall have the same property.
 - if one Vcl/Vpl is a segment end point the other shall also be a segment end point etc.
